

Intelligent Systems: Reasoning and Recognition

James L. Crowley

MoSIG M1
Exercise 1

Winter Semester 2021
4 Feb 2021

Performance Evaluation Metrics

- 1) What is an ROC curve and how is it used?
- 2) What does it mean for an ROC curve to pass below the line from $(0, 0)$ to $(1, 1)$? Use the mathematics to explain your answer.
- 3) You are given a classifier with an ROC curve for that passes the point $(\text{TPR} = 0.99, \text{FPR} = 0.1)$. Is it possible to determine the Probability of Error for the classifier at this point? If yes, give the formula. If no, explain why.
